Notes:

The graph circle represents the vertices, Numbers represent selected vertex number and edges are represented by lines with end points as vertices. The lines with single arrow one side adjacency and with two sides arrows represents both sides adjacency.

As the number of connections, adjacency. connections between the vertices increases the graph gets populated with lines and the process of drawing graph by hand gets difficult. We can think of wireless network adjacency matrix graph. Its very difficult to produced graph network of such matrix and visualisation is not very productive.
